PSYCHOLOGY (BA)

CAREER LEVEL
Undergraduate

DEGREE
Bachelor of Arts

COLLEGE
College Of Science

Psychologists explore behavior and mental processes. They employ scientific methods to diagnose and treat individuals with behavioral problems and conduct research on principles of behavior.

Psychologists explore the mysteries of the mind and brain, and the biological, social, cultural and developmental factors that influence behavior. They use scientific methods to understand the complex interactions of these processes and to diagnose and treat individuals with psychological, neurological, and behavioral problems.

Psychologists work primarily in research, teaching, and clinical or social service fields, and may be employed in universities, schools, hospitals, clinics, businesses, government and industry. Many careers in psychology require advanced training. Students who wish to be psychologists, psychiatrists, social workers, or counselors should plan to go on to medical or graduate school. However, the discipline of psychology provides individuals with the tools for developing effective approaches to solving human problems, regardless of their chosen career path.
